Problem 11

Problem 1. $\forall X \in PNat, \forall L \in NatList, has(drop(L, X), X) = false.$

Proof. By structural induction on L.

(1) Base case

What to show: has(drop(nil, x), x) = false where $x \in PNat$.

$$\frac{\operatorname{has}(\operatorname{drop}(nil, x), x) \longrightarrow \operatorname{\underline{has}(nil, x)}}{false} \qquad \text{(by drop1)}$$

$$\frac{\operatorname{has}(\operatorname{\underline{has}(nil, x)})}{false} \qquad \text{(by has1)}$$

(2) Induction case

What to show: has(drop(y | l, x), x) = false

Induction hypothesis: has(drop(l, x), x) = false

where $x, y \in PNat$ and $l \in NatList$.

We use case splitting for our proofs as follows:

Case 1: y = x

$$\begin{array}{c} \operatorname{has}(\operatorname{drop}(\underline{y}\mid l,x),x) \longrightarrow \operatorname{has}(\underline{\operatorname{drop}(x\mid l,x)},x) & (\operatorname{by\ case\ splitting}) \\ \longrightarrow \operatorname{has}(\operatorname{if\ }\underline{(x=x)} \operatorname{\ then\ drop}(l,x) \operatorname{\ else\ }(x\mid \operatorname{drop}(l,x)) \operatorname{\ fi},x) \\ & (\operatorname{by\ drop}2) \\ \longrightarrow \operatorname{has}(\underline{\operatorname{if\ }true\ \operatorname{then\ drop}(l,x) \operatorname{\ else\ }(x\mid \operatorname{drop}(l,x)) \operatorname{\ fi},x)} \\ & (\operatorname{by\ equality}) \\ \longrightarrow \underline{\operatorname{has}(\operatorname{drop}(l,x),x)} \\ \longrightarrow \underline{\operatorname{false}} & (\operatorname{by\ IH}) \end{array}$$

Case 2: (y = x) = false

$$\operatorname{has}(\underline{\operatorname{drop}(y\mid l,x)},x) \longrightarrow \operatorname{has}(\operatorname{if}\underline{(y=x)} \operatorname{then}\operatorname{drop}(l,x) \operatorname{else}(y\mid \operatorname{drop}(l,x)) \operatorname{fi},x)$$
(by drop2)
