Problem 8

Problem 1. $\forall L1, L2 \in \text{NatList}, \text{diff}(L1, L2) = \text{diff}(L1, \text{rev}(L2))$

Proof. By structural induction on L1.

(1) Base case

What to show: $\operatorname{diff}(nil, l2) = \operatorname{diff}(nil, \operatorname{rev}(l2)).$ where $l2 \in \mathtt{NatList}.$

$$\underline{\operatorname{diff}(nil, l2)} \longrightarrow nil \qquad \text{(by diff1)}$$

$$\underline{\operatorname{diff}(nil,\operatorname{rev}(l2))} \longrightarrow nil \tag{by diff1}$$

(2) Induction case

What to show: $\operatorname{diff}(x \mid l1, l2) = \operatorname{diff}(x \mid l1, \operatorname{rev}(l2))$ Induction hypothesis: $\operatorname{diff}(l1, l2) = \operatorname{diff}(l1, \operatorname{rev}(l2))$ where $x \in \operatorname{PNat}$ and $l1, l2 \in \operatorname{NatList}$.

$$\frac{\operatorname{diff}(x \mid l1, l2)}{\operatorname{diff}(x \mid l1, l2)} \longrightarrow \operatorname{if} \operatorname{has}(l2, x) \operatorname{then} \underbrace{\operatorname{diff}(l1, l2)}_{\text{(by diff2)}} \operatorname{else} (x \mid \underbrace{\operatorname{diff}(l1, l2))}_{\text{(by diff2)}} \operatorname{fi}$$

$$\longrightarrow \operatorname{if} \operatorname{has}(l2, x) \operatorname{then} \operatorname{diff}(l1, \operatorname{rev}(l2)) \operatorname{else} (x \mid \operatorname{diff}(l1, \operatorname{rev}(l2))) \operatorname{fi}$$

$$(\text{by IH})$$

$$\operatorname{diff}(nil,\operatorname{rev}(l2))\longrightarrow \text{if has}(\operatorname{rev}(l2),x) \text{ then } \operatorname{diff}(l1,\operatorname{rev}(l2)) \text{ else } (x\mid\operatorname{diff}(l1,\operatorname{rev}(l2))) \text{ fi}$$

(by diff2)
$$\longrightarrow$$
 if has($l2, x$) then diff($l1, rev(l2)$) else ($x \mid diff(l1, rev(l2))$) fi
(by Problem 6)
