## Problem 11

**Problem 1.**  $\forall X \in PNat, L \in NatList, has(drop(L, X), X) = false.$ 

*Proof.* By structural induction on L.

## (1) Base case

What to show: has(drop(nil, x), x) = false where  $x \in PNat$ .

$$\frac{\operatorname{has}(\operatorname{drop}(nil, x), x) \longrightarrow \operatorname{\underline{has}(nil, x)}}{false} \qquad \text{(by drop1)}$$

$$\frac{\operatorname{has}(\operatorname{\underline{has}(nil, x)})}{false} \qquad \text{(by has1)}$$

## (2) Induction case

What to show: has(drop(y | l, x), x) = false

Induction hypothesis: has(drop(l, x), x) = false

where  $x, y \in PNat$  and  $l \in NatList$ .

We use case splitting for our proofs as follows:

Case 1: y = x

$$\begin{array}{c} \operatorname{has}(\operatorname{drop}(\underline{y}\mid l,x),x) \longrightarrow \operatorname{has}(\underline{\operatorname{drop}(x\mid l,x)},x) & (\text{by case splitting}) \\ \longrightarrow \operatorname{has}(\operatorname{if}\,\,\underline{(x=x)}\,\,\operatorname{then}\,\operatorname{drop}(l,x)\,\operatorname{else}\,(x\mid\operatorname{drop}(l,x))\,\operatorname{fi},x) \\ & (\operatorname{by}\,\operatorname{drop}2) \\ \longrightarrow \operatorname{has}(\underline{\operatorname{if}\,\,true}\,\,\operatorname{then}\,\operatorname{drop}(l,x)\,\operatorname{else}\,(x\mid\operatorname{drop}(l,x))\,\operatorname{fi},x) \\ & (\operatorname{by}\,\operatorname{equality}) \\ \longrightarrow \underline{\operatorname{has}}(\operatorname{drop}(l,x),x) & (\operatorname{by}\,\operatorname{if1}) \\ \longrightarrow \underline{false} & (\operatorname{by}\,\operatorname{IH}) \end{array}$$

**Case 2**: 
$$(y = x) = false$$

$$\begin{array}{c} \operatorname{has}(\operatorname{\underline{drop}}(y\mid l,x),x) \longrightarrow \operatorname{has}(\operatorname{if} \ \underline{(y=x)} \ \operatorname{then} \ \operatorname{drop}(l,x) \ \operatorname{else} \ (y\mid \operatorname{drop}(l,x)) \ \operatorname{fi},x) \\ & \qquad \qquad (\operatorname{by} \ \operatorname{drop}2) \\ \longrightarrow \operatorname{has}(\operatorname{\underline{if}} \ false \ \operatorname{then} \ \operatorname{drop}(l,x) \ \operatorname{else} \ (y\mid \operatorname{drop}(l,x)) \ \operatorname{fi},x) \\ & \qquad \qquad (\operatorname{by} \ \operatorname{case} \ \operatorname{splitting}) \\ \longrightarrow \operatorname{\underline{has}}(y\mid \operatorname{drop}(l,x),x) \qquad \qquad (\operatorname{by} \ \operatorname{if2}) \\ \longrightarrow \overline{(y=x)} \ \operatorname{or} \ \operatorname{has}(\operatorname{drop}(l,x),x) \qquad \qquad (\operatorname{by} \ \operatorname{has2}) \\ \longrightarrow \underline{false} \ \operatorname{or} \ \operatorname{has}(\operatorname{drop}(l,x),x) \qquad \qquad (\operatorname{by} \ \operatorname{case} \ \operatorname{splitting}) \\ \longrightarrow \operatorname{\underline{has}}(\operatorname{drop}(l,x),x) \qquad \qquad (\operatorname{by} \ \operatorname{or}) \\ \longrightarrow \overline{false} \qquad \qquad (\operatorname{by} \ \operatorname{IH}) \end{array}$$
